

## La Mindin

### Flood intervention to merge communities

In the region of Pays de la Loire, France, a town of St Brevin most people would know for either a destination for summer water sports due to its geography being next the delta of the Loire rivers and high wind speed year-round, or a retirement home for some demographics. St Brevin although a beautiful place and a nice infrastructure that support French older generations, prone to flood during the wet season yearly that flow down from the inner part of land down and concentrated on important area of the city. The problem aggravated by the fact of sea level rise that can devour 30% of St. Brevin and fully cover the only Geriatrics hospital making it unable to function and inaccessible during the floods.

La Mindin plans to use the existing un-use land located at the center of St Brevin sandwiched between two main highway allowing the people to access the area. Those lands are converted to a new water basin collecting most of the water that would've gone to the hospital. One of the land's features is both opposite seasons will make the land either too wet or too hard. Making it accessible during the summer is popular for bird watch and other types of activities. To make this land accessible all year round an adaptable infrastructure should be developed to blend in the landscape and activate during the floods. Key areas are placed between intersections of those paths creating an attractive meeting point for people to orientate themselves and have a goal for their strolls.

This Project not only mitigate the flood risk of Mindin but also an infrastructure that help scattered communities come together in the center of their united communities.
