

“THE BED”

Volume zero ‘tiny house’ competition

The Bed is a design concept that explores how to make a limited space, often seen as a discouraging environment, optimally comfortable and versatile. Inspired by our personal experiences of being bed-people (individuals who do everything in bed), The Bed seeks to support and direct a new alternative to comfortable living. The project offers a dynamic solution to those who have an affinity to the “everyday-in-bed” lifestyle and a new way of life to those leading more conventional lives. It does so by applying concepts of dynamic posture arrangement to the design, all the while adhering to two main goals: comfort and functionality.

The challenge of designing The Bed lies in maximizing comfort and efficiency within a restricted space. By prioritizing ergonomics, the project addresses the body's natural need for support during different activities, from resting to working or reading. The design carefully considers how the body moves and adjusts throughout the day to ensure that every element of the bed – from the mattress to the headrest and storage solutions – enhances the user's experience. By understanding the need for a balance between relaxation and productivity, The Bed transforms the notion of a traditional sleeping space into a multifunctional haven. Through attention to detail, this design redefines comfort, offering an optimal space for both rest and daily activities in one cohesive environment.
