

I'M YOUR AC

Perspective render

Physical model picture

Problem:

I'm Park Chula is an open-air mall that is located in the Chula district. Therefore, the main issue was the heat. This issue was one of the foremost problems that most visitors encountered, and they are hoping for better in order to facilitate their satisfaction.

Solution:

Hence, building a water fountain will help solve this issue; adding humidity to the air will help to cool down the area. Not only that, the location where the water fountain will be placed is the area where it most interacts with wind. Hence, this provides a greater advantage to cool down the area. Despite that, this project will help to sustain the interaction between humans and the environment by not implementing an air conditioner but a structure that is nature-based.

SEATING AREA PERSPECTIVE

In the seating area on the ground floor, there is seating provided where visitors can sit and observe the bottom level of the fountain. Moreover, visitors can enjoy the relaxation by putting their feet in the water.

SECOND FLOOR PERSPECTIVE

The second floor area is where most visitors are seated and used as an eating area. At this floor the perspective will allow the visitors to observe the beauty of how the water emerges out of the bowl-like structure. This gives a sense of calmness.
