

For my Year 1, Term 1 project, I chose the Chula Tunnel as the site for my design intervention. This tunnel is located in the center of the university and serves as a common route for many students and faculty members each day. Its strategic location and constant foot traffic made it an ideal space to explore how design can enhance everyday experiences. The concept for the project stemmed from a twisting form experiment, which inspired the dynamic structure of the new design. I combined this experiment with the tunnel's original purpose — a walkway that encourages light physical activity. By reimagining the space, I aimed to create an environment that not only maintains its functional role as a passageway but also adds value through movement, interaction, and engagement. The result is a design that respects the tunnel's existing use while inviting users to connect with the space in a more active and meaningful way.
