

EASELINE SKYWALK

The Easeline Skywalk is an organic, self-supporting structure inspired by the circular form of a timer switch. Designed without poles, it features three strategically placed entrances/exits in high-traffic areas to enhance accessibility. The skywalk is constructed with transparent glass and reflective blue tiles along the pathway, creating an airy atmosphere by amplifying sky and light reflections—offering contrast to the dense surroundings. Moreover minimal thin handrails provide safety while maintaining visual openness. This innovative design aims to connect locals and passersby, fostering community interaction and transforming the space into a harmonious blend of functionality and modern aesthetics.
